

TARGETED RADIOFREQUENCY THERAPY

TARGETED RADIOFREQUENCY THERAPY

HEALING ENERGY TRANSFER

The BTL-6000 TR-Therapy (Targeted Radiofrequency Therapy) distributes high-frequency electromagnetic energy into the desired tissue which leads to selective tissue hyperthermy. Thanks to this mechanism patients experience instant pain relief, muscle relaxation, edema reduction, tissue regeneration support and healing.

The most common indications include: local muscle spasm, trigger points, myalgia, tendinitis, cervical pain, and post-traumatic edema. The immediate therapeutic effect is noticed by the patient instantly and lasts long after the therapy. Combination of the therapist's manual skills and the BTL-6000 TR-Therapy makes this therapeutic concept the most modern therapy for on-the-spot results.

In 2014, the BTL-6000 was granted the Red Dot Design Award, one of the most respected product design awards worldwide, for its superior functionality, level of innovation, formal design quality and technological expertise. The BTL-6000 TR-Therapy design incorporates these high standards and qualities.

NEW ERA IN TISSUE HYPERTHERMY

TARGETED RADIOFREQUENCY THERAPY

MECHANISM OF ACTION

The BTL-6000 Targeted Radiofrequency Therapy transfers high frequency electromagnetic energy through the tissues of the body creating selective tissue hyperthermy. It has been scientifically proven to bring therapeutic effects such as immediate and intense pain relief, muscle relaxation, edema reduction and supporting tissue regeneration and healing.

MEDICAL EFFECTS

MUSCLE RELAXATION

The precise and aimed effect of the Targeted Radiofrequency Therapy on the hypertonic muscle fibers causes their immediate relaxation. The effect of myorelaxation is primarily based on vasodilation, which occurs immediately during the therapy and is responsible for higher supply of nutrients into the tissue.

TISSUE REGENERATION AND HEALING

The improvement of tissue metabolism is a natural and valuable secondary outcome of the therapy. It leads to faster healing of the traumatized soft tissue and faster resorption of post-injury haematomas.

EDEMA REDUCTION

The walls of the arterioles are enlarged and the precapillary sphincters relaxed, allowing increased local blood perfusion. This leads to an increase of the lymphatic processes (drainage) and subsequently to reduction of the edema.

PAIN RELIEF

The principal effect of the Targeted Radiofrequency Therapy—the pain relief—results from muscle relaxation, edema reduction, tissue regeneration and healing.

THERMAL PROFILE

Local hyperthermy of the treated area is shown in thermal images taken by an infrared camera immediately after the therapy. It is caused by vasodilation, one of the effects of the therapy.

CERVICOTHORACIC PAIN

EPICONDYLITIS

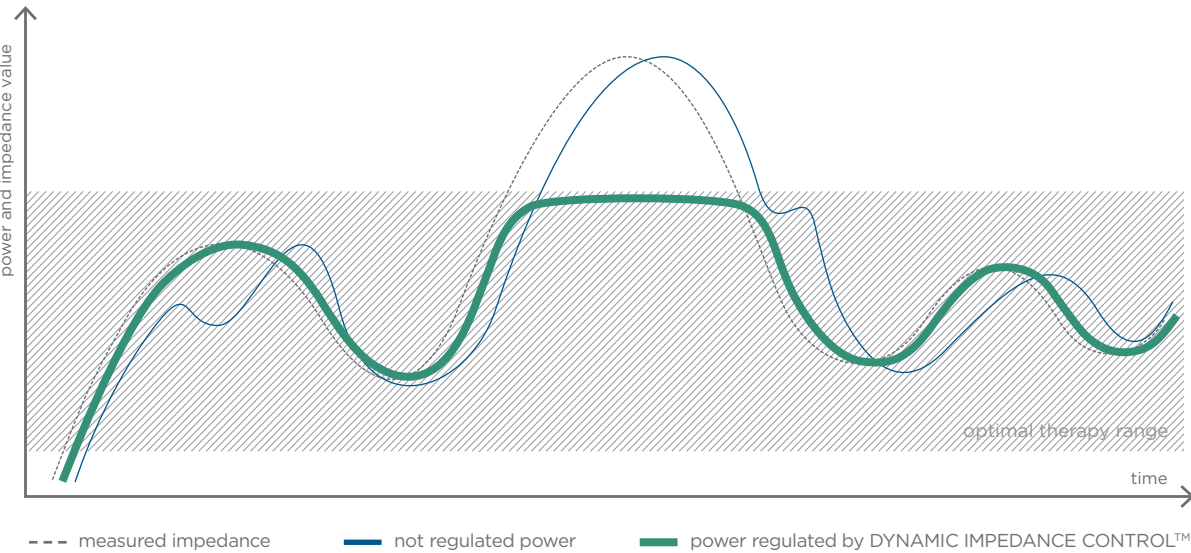

EXCEPTIONAL TISSUE SELECTIVITY

Two different electrodes (capacitive and resistive) of the Targeted Radiofrequency Therapy provide precise and effective treatment at any tissue level. The capacitive electrode focuses the therapy into muscle layers. The resistive electrode targets tissue with higher impedance such as muscular insertions, tendons and bone surfaces.

DYNAMIC IMPEDANCE CONTROL™

Dynamic Impedance Control™ automatically regulates power throughout the Targeted Radiofrequency Therapy. The impedance of the tissue is measured during the whole therapy. The power is modulated to fit the exact characteristics and conditions of the treated tissue. Since the peak values are regulated at the same time, the tissue is evenly heated regardless of its immediate impedance.

BTL-6000

TR-THERAPY ELITE

BTL-6000 TR-THERAPY ELITE

- 320 W power
- 8.4" colour touch screen

FEATURES & BENEFITS

- QUICK protocols
- Body Parts navigation
- Patient database
- Preset protocols and therapeutic encyclopaedia
- Ergonomic applicators with audiovisual contact control
- Tissue selectivity with capacitive and resistive mode
- Continuous and pulsed therapy options
- Dynamic Impedance Control™
- Trolley*

*optional

Capacitive applicator
Ergonomic applicator
with audiovisual contact control

Resistive applicator
Ergonomic applicator
with audiovisual contact control

Touch operation
Intuitive operation with
colour touch screen (8.4")

BTL-6000

TR-THERAPY PRO

BTL-6000 TR-THERAPY PRO

- 150 W power
- 5.7" colour touch screen

FEATURES & BENEFITS

- Preset protocols and therapeutic encyclopaedia
- Tissue selectivity with capacitive and resistive mode
- Continuous and pulsed therapy options
- Dynamic Impedance Control™
- Trolley*

*optional

Patient cable
For capacitive
electrode

SUPERIOR APPLICATOR TECHNOLOGY

The core of the Targeted Radiofrequency Therapy system lies in its ergonomically designed applicator with the latest functional features. The applicator allows various types of grip for different application techniques, while the applicator's surface is made of soft and dirt-resistant material for comfortable and pleasant use. Other special features, such as audiovisual contact control and plastic insulation of the electrodes continuously make the therapist's work more effective and safe.

TECHNIQUES

DIFFERENT CONCEPT FOR YOUR THERAPY

STEP-BY-STEP THERAPY

LOCATE THE DISORDER

Use appropriate diagnostic methods to locate the area to be treated.

PLACE THE NEUTRAL ELECTRODE

Place the electrode in close proximity to the treated area.

APPLY THE CONDUCTIVE CREAM

Use an adequate amount of cream at the treated segment.

USE CAPACITIVE MODE

For the first phase of the treatment, use the capacitive electrode. The capacitive electrode targets the superficial muscle tissue.

USE RESISTIVE MODE

For the second phase of the treatment, use the resistive electrode. The resistive electrode selectively affects muscular and fibrous insertions located deeper within the tissue.

MOST COMMON APPLICATIONS

Cervical pain

Impingement syndrome

Frozen shoulder

Low back pain

Triceps regeneration

Quadriceps relaxation

Metatarsalgia

Myalgia

TR-THERAPY CONCEPT

The Targeted Radiofrequency Therapy delivers a new concept, allowing for effective combination of the therapist's unique skills with physical modality. The effect of the therapy is significantly improved through this simultaneous action and the therapy brings instant and long-lasting results.

① TR-THERAPY MASSAGE TECHNIQUE

The Targeted Radiofrequency Therapy, in combination with soft tissue techniques, enhances the therapeutic effect by increasing the blood perfusion and the nutrient, oxygen and defence-agent supply of the treated tissue. The combination, used for reflexively caused muscular hypertonus, leads to its faster and easier removal.

② TR-THERAPY PASSIVE MOTION TECHNIQUE

The Targeted Radiofrequency Therapy helps relieve trigger points and muscle spasms that prevent regaining the full range of joint movement. For example use of the Targeted Radiofrequency Therapy in combination with passive stretching of the shortened structures leads to their relief and immediately broadens the range of motion in the given segment.

③ TR-THERAPY MUSCLE ACTIVATION TECHNIQUE

Combining the Targeted Radiofrequency Therapy and isometric or isotonic muscle contraction focuses the hyperthermy into the contracted muscle. Delivered radiofrequency energy facilitates these fibers and leads to their incorporation in the performed muscle stereotypes.
